Overview

This add-on module enables Cumulus to automatically catalog assets from any location on your network as well as emails and assets from a mail server. Users attach assets to email they send to a central email account. Cumulus checks that email account and catalogs all emails and attachments it finds. Attachment asset records are automatically related to the email asset records by Cumulus.

This module enables you to configure the Cumulus Scheduler to autocatalog assets from any location on your network, at any interval you need. There's no need to leave a Cumulus Client application running, because the Cumulus Scheduler will handle it all. More than drop-folder cataloging, this capability can serve as a basis for interfacing Cumulus with other systems that produce documents, such as invoicing systems or software that produces on-demand PDFs (or other formats). Within minutes of those files being produced, they can be safely cataloged into Cumulus and be available to you from anywhere.

For details on all of Canto's Digital Asset Management products and services go to www.canto.com

Installation & Registration

This add-on module expands the functionality of a Cumulus installation. It is already included in the Cumulus Client and Cumulus Server software. This means that it does not need to be installed separately. In order to get the full functionality, it has just to be activated by the Cumulus Administrator via the Remote Admin section of the Server Console and the Customer Portal Account. For detailed information on how to activate Cumulus and additional options, see the Installation Guide.

Product Documentation

For more information, see the Cumulus Administrator Guide section "Schedulder Manager" in the chapter "Server Console".
